ACKNOWLEDGEMENTS

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Statistical Reporting Service. Shipment and market price data are from the Bureau of Market News and USDA's Agricultural Marketing Service. Canned and frozen pack statistics were compiled by the Florida Canners Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services were employed in production and utilization estimates. The Growers Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of Paul E. Shuler and James W. Todd of the Florida Crop and Livestock Reporting Service, and E. F. Scarborough, Bureau of Market News.

Peninsula Florida Weather: Character of the
October 1971--March 1973 Season

The 1971-72 season was one of the warmest and least frost-damaging winters of record on the peninsula. Only 23 cold nights occurred (a cold night is defined as a night on which one or more temperature survey stations reached 36° F or lower) which ties the record of the 1948-49 season. Records date back to 1937.

Lower East Coast District did not record a 32° F temperature for the first time. The Indian River District experienced only three hours (Feb. 21) of freezing conditions during the winter. Only two nights with freezing temperatures occurred in the Everglades District, and three nights of 32° F or lower were reported from the Central Florida Districts: Ridge, Bartow and West Coast. Some spotty firing for citrus cold protection was needed only on February 21.

Season's rainfall was about eight inches above normal over north portions of the peninsula, near to a little below normal in Central, and near to above normal in South Florida. However, the rainfall distribution was such that irrigation was needed sporadically throughout the winter.

NOVEMBER brought a couple of cold nights as far south as the Ridge District, but freezing temperatures were limited to the Gainesville District.

DECEMBER was very warm with no cold nights anywhere on the peninsula for the first time on record.

JANUARY temperatures continued to average well above normal, as only four cold nights occurred. A 32° F reading was noted as far south as Manatee County on the West Coast.

FEBRUARY saw frequent surges of cold air move southward through Florida, resulting in nine cold nights. High pressure following a cold frontal passage on the 18th settled over the state giving four consecutive nights of threatening temperatures--mornings of the 19th through the 22nd.

The most widespread cold was on the 21st when scattered light frost was reported at several stations along the Lower East Coast, and most sections of the peninsula recorded the coldest for the season.

MARCH had four cold nights occurring on the peninsula during the first half of the month, but freezing temperatures occurred only in the Gainesville District.

1971-72 PRODUCTION SUMMARY

Florida's 1971-72 season began with many groves in poor condition due to a series of cold waves that hit along the west coast and colder areas of the State's interior in November 1970 and January 1971. Trees less than 15 years old were especially hard hit. Peak bloom appeared somewhat later than usual, due to the late cold. Fruit set was very spotty and a drier than normal spring adversely affected its holding ability. By mid-summer soil moisture had improved and growers where they considered it economically feasible, began a maximum effort to rejuvenate damaged groves.

In October it was estimated there would be 131.0 million boxes of oranges for the 1971-72 season, which would still be the third largest crop in history. Grapefruit production was estimated at 43.0 million boxes, the second largest crop ever. It was obvious the expansion along Florida's east coast more than off-set any reduction from the freeze damage on the West Coast. At the same time yield of 45 degree brix FCOJ was forecast to be 1.28 gallons per box, just an average outlook.

The favorable growing conditions continued into the fall months with ample rainfall and above average temperatures. On December 10 an additional 5.0 million boxes were added to the orange forecasts to cover above average fruit growth. The grapefruit forecast was also increased by 1.0 million boxes. Still the ideal winter weather continued with weathermen stating Florida was experiencing its warmest winter in more than 40 years. The winter's first cold wave hit on February 4 and 5, then there was a continuing series of cold fronts that crossed the citrus belt at intervals of 7 to 10 days till mid-March. These didn't have any measurable effect on the trees but the cool nights kept delaying the bloom. New buds began appearing in January but peak bloom for the upcoming 1972-73 crop didn't actually come till the first week in April. Bloom was uniformly heavy on most crops. Only grapefruit gave indications of being spotty. During the winter months soil moisture was adequate.

By the season's end it was obvious the ideal growing condition that had prevailed throughout the winter had produced several significant developments. A larger fruit crop for the 1971-72 season than had been forecast was being harvested, phenomenal tree recovery had occurred in areas where there had been cold damage the winter before, and a bumper crop of fruit for the up-coming 1972-73 season was developing. The forecast yield for FCOJ varied some during the season but was eventually set at 1.28572, very close to the October projection. A record volume of FCOJ was produced, 134,229 million gallons, up 7 percent from the 1970-71 season. However, it was only 2 percent larger than the previous record pack put up in 1966-67.

California's citrus groves were generally in good condition going into the 1971-72 season. Set of fruit was better than average but sizes were somewhat smaller, especially navels. Rainfall was quite adequate in the fall months but was short in the spring and into early summer, only about half of normal amounts. There were several moderate cold waves during the winter. The principal one hit on January 4 and 5 causing limited loss to Valencias and Tangerines in the Coachella Valley and unprotected groves in Central California. A heavy bloom for the 1972-73 season was reported on about April first in all districts.

Texas' citrus groves were in good condition as harvest of the 1971-72 season began. Fruit set was spotty but sizes were good. Heavy rain in the fall produced sufficient soil moisture that was generally maintained throughout the winter months by continued light rains and with aid of some irrigation. One moderate cold wave hit the fruit area on January 5 but did not cause any measurable damage. Trees began blooming in early March and were in full bloom by mid-month. Heavy rains at that time were credited with helping to set a uniformly heavy crop. Prospects for citrus in the 1972-73 season looked bright.

Arizona. The State's trees were generally in poor condition at the start of the 1971-72 season, due to damage from the January 1971 freezes. However, heavy rainfall throughout the summer and into the winter months set the stage for excellent tree recovery. A mild winter during the 1971-72 season further contributed to their development. Many of the badly damaged trees were topworked to other varieties. Groves were reported to have been in full bloom by the end of March with most trees looking good.

AERIAL PHOTOGRAPHY

Citrus acreage shown in this summary was obtained from the fourth biennial citrus tree census which utilized photography. Photos were taken beginning in November 1971, interpreted in the Orlando office followed by ground checks and a preliminary summary available by early September of 1972.

FOREIGN EXPORT

Exports of fresh Florida citrus during the 1971-72 season centered primarily on grapefruit where there was a resounding increase over the previous season. Lifting of import restrictions on grapefruit into Japan is credited for the majority of the increase for that variety. Many observers are now projecting an even larger fresh grapefruit shipment to Japan during the coming season as the results of an intensive advertising and promotion campaign begins to take shape and the popularity for the fruit continues to grow.

* * * * *

The net contents of a box of fruit varies between types of fruit and between States. The citrus code defines weight of a standard box of fruit in Florida. The table below shows net weight of these various boxes as recognized by the United States Department of Agriculture and those States involved.

**Citrus Box Weights: Approximate Net Weight in Pounds
by Fruit Type and States**

States	Oranges and others 1/	Grape fruit	Tange- rines	Lemons	Limes

Summary of On-Tree Prices and Value of Sales

1971-72 Preliminary Citrus Value A Record

The preliminary on-tree value of all citrus sales for the 1971-72 season established an all time high of \$431,560,000. Returns were 37 percent above the 1970-71 season and 28 percent higher than the previous record set by the 1963-64 crop. Oranges continue to dominate the citrus market with 67 percent of all sales.

Preliminary on-tree value of oranges was \$289,852,000 for 1971-72 compared to \$208,146,000 for the previous season. The average price growers received for oranges during the 1971-72 season was \$2.11 per box, up 45 percent from the \$1.46 received in 1970-71. Early and mid-season fruit registered the best gain in average prices; nearly double the 1970-71 fruit prices which had some salvage fruit due to freeze damage.

This past season grapefruit became the Cinderella crop when the on-tree return reached a record \$108,095,000, one-third higher than returns in the 1970-71 season. A record crop size coupled with very strong demand accounted for the sharp jump in value of sales. Average on-tree price of grapefruit for all methods of sales was \$2.30 up 39 cents per box from the \$1.91 in 1970-71. This is the third season in a row that the on-tree price of grapefruit has been higher than round oranges.

Most of the speciality fruit types had comparable increases in on-tree value. Only for Temples was there a lower value, due in part to poor quality fruit which did not hold up well for fresh shipment.

Value

Florida, All Citrus: Value of Sales, On-Tree Crop Years
1962-63 through 1971-72

Year	Value	Year	Value
1962-63	\$ 250,683,000	1967-68	\$ 308,876,000
1963-64	337,087,000	1968-69	286,769,000
1964-65	274,476,000	1969-70	244,676,000
1965-66	225,408,000	1970-71 1/	315,882,000
1966-67	178,075,000	1971-72 2/	431,560,000

1/ Revised. 2/ Preliminary.

1970-71 Final Citrus Prices

The final on-tree value for the 1970-71 crop rose 10 percent above the preliminary value of sales based on cash and spot prices. Increased value of processed products held by cooperatives and market participation groups accounted for the higher returns for fruit. The biggest change was in oranges. Final prices for early and mid-season fruit were 47 percent above estimated cash prices. The cash price reflected salvage sales of freeze damaged fruit. Final returns for Late oranges were 7 percent less than preliminary estimates.

Official Citrus Prices

All on-tree citrus prices of the U. S. Department of Agriculture compiled by the Statistical Reporting Service

and the Florida Crop and Livestock Reporting Service represent the price growers received. They are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Beginning with the first month in each season that approximately 3 percent of a fruit type is harvested, the Florida Crop and Livestock Reporting Service establishes an average mid-month price. Fresh fruit sales organizations provide the average F.O.B. price and processors supply an average cash price for fruit delivered to plants. From these values an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales for each month. At the end of the season monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, a survey of fruit sold by cooperatives and firms with marketing participation plans is conducted. These prices, combined with spot and cash prices collected earlier, are weighted together to determine the final price received by growers for various varieties of citrus. Charges for picking, hauling, and packing, as determined by University of Florida economists are deducted from the weighted average of prices obtained from all segments of the citrus industry to arrive at the final on-tree price received by producers.

For the 1970-71 season processors supplied data on returns to growers for 108 million boxes of fruit which they processed. This included 70 percent of all oranges processed.

* * * * *

Change in Production Statistics

A change in policy by USDA'S Statistical Reporting Service has slightly modified the level of production estimates for 1971-72. The allowance for farm home use was eliminated from the 1971-72 estimate and will not be included in the future. Estimates prior to 1971-72 were not revised because the impact of this elimination was so slight. To maintain comparability with the historical series of data for years before 1971-72, boxes in the home use item were added to the commercial fresh fruit volume. The established price for fresh fruit was given to this volume which resulted in a slight increase in cash value of sales when compared with earlier publications.

In addition, in Florida more information has become available in the past 3 years on the volume of fruit sold at roadside and as gift fruit. This additional information resulted from the State law requiring recurring inspections of these fruit outlets. In recognition of these hard data, the Florida Crop and Livestock Reporting Service has reduced its allowance for these local sales of fresh fruit not inspected on a continuous basis.

For want of a better term, this fruit, sold largely in gift fruit packs and at roadside is termed "non-certified." Fruit from commercial packinghouses and identified on certificates by the Division of Fruit and Vegetable Inspection Service as "interstate", "intrastate" and "export", and all fruit processed is regarded as "certified."

HISTORY OF FLORIDA'S CITRUS INDUSTRY

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were growing in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest cultivated groves planted in Florida (Hume, 1926, p. 95) is thought to be the Don Phillippe grove in Pinellas County, planted some time between 1809 and 1820. Several of the original trees still remain. It is believed that Duncan Grapefruit originated from these trees. The site is now Don Phillippe Park just north of Safety Harbor.

Citrus production in Florida had reached the all time high to more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased and by the mid-forties Florida was producing more than half the nations citrus fruit supply. Florida surpassed all other States in bearing citrus acreage in 1932-33 with 265,400 acres, which accounted for 46 percent of the United States total bearing acreage. As the decade of the seventies began Florida's dominance of the nations citrus became even more apparent. In 1971-72 the state had 69.5 percent of the nations bearing acreage and 72.3 percent of the production.
